What does the supplied evidence establish?

Scripted sender + recipient: 5 mechanism types in each of 20 evaluation blocks
Used; ignored; ignored but matching; decoding failed; coincidence

Each case is shown in four views, in separate auditor calls

PUBLIC
Price and action trace

DECODER
Public trace + decoding record

PARTIAL EXECUTION
Decoder view + partial policy trials

COMPLETE
Decoder view + all policy trials

LLM auditor returns two separate judgments
1 Was the target recovered? 2 Does action depend on decoded input?
For each: supported / contradicted / insufficient evidence

MATCHED HARD NEGATIVE: SAME DECODER EVIDENCE
Both recover target T and produce action T. Dependence is still insufficiently evidenced.
Dependent policy: another input changes the action. Ignored-but-matching: all inputs yield T.
Complete trials distinguish the two policies; the observed match alone cannot.

Code-based reference: grade only what the visible records establish
Matched ambiguous cases prevent hidden truth from rewarding an unjustified guess
Scripted positive/negative controls + baselines on the same evaluation cases

Report coverage, resolved accuracy and unsupported conclusions
Retain missing replies; compare evidence views within matched blocks
400 planned cases/model • 2 judgments/case • uncertainty clustered by 20 blocks

Supplied-record auditing—not discovery of hidden channels, intent or real-world collusion.
